

Revision on important Concepts this week...

EVIDENCE PROCESSING - OS & FILE SYSTEMS

DISK PARTITION – BEFORE A **DRIVE** (A,B,C,D) CAN BE USED BY ANY OS, A **PARTITION TABLE** NEEDS TO BE CREATED ON THE DRIVE. **PARTITION TABLE** IS STORED IN **MASTER BOOT RECORD (MBR)**, SECTOR 0.

- The **MBR** is the information in the **first sector** of any hard disk that identifies how and where an operating system is located so that it can be **boot** (loaded) into the computer's main storage or random access memory. As such, the **MBR** holds the information on how the logical partitions, containing **file systems**, are organized on that medium.

RAM SLACK & FILE SLACK

- What is **RAM Slack** & **File Slack**?
- Given required information such as **drive size**, **data/file size** and etc, how do we determine **cluster size**, calculate **RAM** and **File slack**.

Revision on important Concepts this week... (Cont)

- ▶ **Cluster, space required for a file is made up of number of sectors**

- ▶ **Number of Cluster Required to Store a File**

- ▶ $(\text{FileSize}) / (\text{ClusterSize})$
= Round Up (ClusterRequired)
- ▶ While ClusterSize is determined by no. of sectors

- ▶ **RAM Slack**

- ▶ Per Sector Size = **512** Bytes (in general)
- ▶ $(\text{SectorsRequired}) = (\text{FileSize}) / (\text{SectorSize}) = \text{Round up} (\text{SectorsRequired})$
- ▶ $\text{Round Up} (\text{SectorRequired}) * \text{Sector Size} = \text{Total Sector Size Required}$
- ▶ $\text{Total Sector Size} - \text{File Size} = \text{RAM Slack}$

- ▶ **File Slack**

- ▶ $\text{File Slack} = (\text{SizeOfClusterRequired}) - (\text{FileSize}) - (\text{RAMSlack})$

Table 5-2 Sectors and bytes per cluster

Drive size	Sectors per cluster	FAT16
8–32 MB	1	512 bytes
32–64 MB	2	1 KB (1024)
64–128 MB	4	2 KB
128–256 MB	8	4 KB
256–512 MB	16	8 KB
512–1024 MB	32	16 KB
1024–2048 MB	64	32 KB
2048–4096 MB	128	64 KB

© Cengage Learning®

Revision on important Concepts this week... (Cont)

- **File Allocation Table (FAT)** – File structure database that Microsoft originally designed for floppy disks
 - Understand what is **FAT**. i.e what is cluster size

Sample disk view of a FAT file structure

- Must understand concept of FAT. i.e **Cluster is made up of sectors and one sector is 512 Bytes**. Cluster number is the logical address in OS
- Need to be able to interpret specifications of FAT

Location	# Bytes	Meaning	Value
01E		OS Boot Loader	
01C	2	# Hidden Sectors	0
01A	2	# Heads	2
018	2	# Sectors / Track	18 (12x)
016	2	# sectors/ FAT	9
015	1	Media Bytes	F0: (floppy)
013	2	# logical sectors	2880(0B40x)
011	2	# Root Dir entries	224 (00E0x)
010	1	# FATS	2
00E	2	# Boot Sectors	1
00D	1	# Sectors/Cluster	1
00B	2	# Bytes/Sector	512 (0200x)
003	8	OEM Name ID	MSDOS5.0
000	3	Jmp to loader	EB 3C 90

Specifications of FAT

Revision on important Concepts this week... (Cont)

- **NT File System – NTFS** : To improve on FAT file system. In NTFS, everything written to disk is a file.
 - **Master File Table (MFT)**
 - Understand how NTFS files are stored in NTFS system
 - Namely “**Resident**” and “**Non-Resident**” - 2 types
- On First data set **NTFS** disk
 - Is the **Partition Boot Sector**
 - Next is **Master File Table (MFT)**
 - **Each file** on an NTFS volume is represented by a **record** in master file table (**MFT**)
- **MFT** contains information about all files on the disk
- In the **MFT**, the **first 15 records are reserved for system files**
- Need to understand **MFT Structures** as well as **Attributes in the MFT**

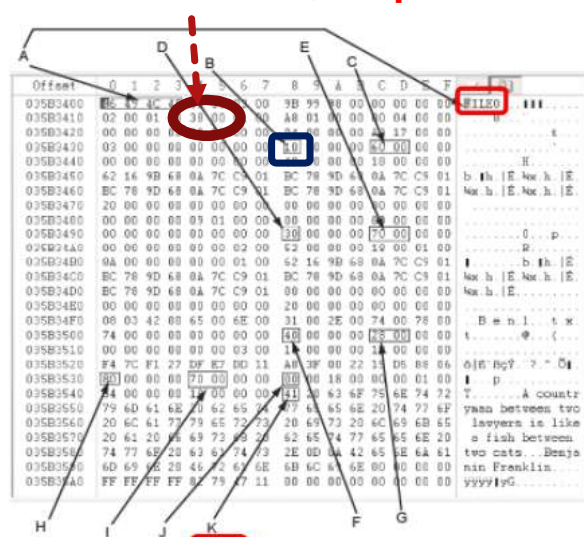

Attribute ID	Purpose
0x10	\$Standard Information This field contains data on file creation, alterations, MFT changes, read dates and times, and DOS file permissions.
0x20	\$AttributeList Attributes that don't fit in the MFT (nonresident attributes) are listed here along with their locations.
0x30	\$File.Name The long and short names for a file are contained here. Up to 255 Unicode bytes are available for long filenames. For POSIX requirements, additional names or hard links can also be listed. Files with short filenames have only one attribute ID 0x30. Long filenames have two attribute ID 0x30s in the MFT record: one for the short name and one for the long name.
0x40	\$Object.ID (\$Volume.Version in Windows NT) Ownership and who has access rights to the file or folder are listed here. Every MFT record is assigned a unique GUID. Depending on your NTFS setup, some file records might not contain this attribute ID.
0x50	\$Security.Descriptor Contains the access control list (ACL) for the file.

The **Master File Table (MFT)** allocates space for each file record. The **attributes** of a file are written to the allocated space in the MFT. Small files and directories (typically 512 bytes or smaller), can entirely be contained within the master file table's record.

Revision on important Concepts this week... (Cont)

MFT and File Attributes (Cont)

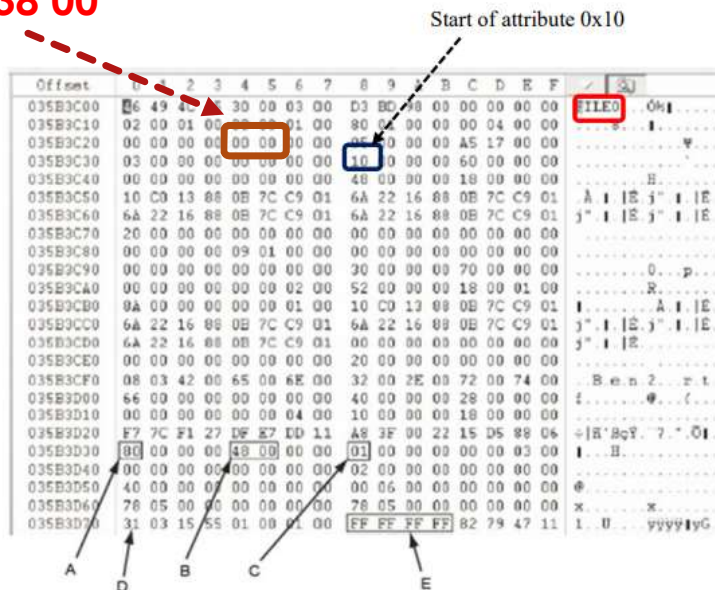

0x14 -> 2nd row, 5th position = 38 00

A: All MFT records start with **FILE0**
 B: Start of attribute 0x10
 C: Length of attribute 0x10 (value 80) 60 00 → 00 60
 D: Start of attribute 0x30 70 00 → 00 70
 E: Length of attribute 0x30 (value 70)
 F: Start of attribute 0x40
 G: Length of attribute 0x40 (value 28)
 H: Start of attribute 0x80
 I: Length of attribute 0x80 (value 70)
 J: Attribute 0x80 resident flag
 K: Starting position of resident data

Figure 5-10 Resident file in an MFT record
 Courtesy of X-Ways AG, www.x-ways.net

Resident file attributes

A: Start of nonresident attribute 0x80
 B: Length of nonresident attribute 0x80
 C: Attribute 0x80 nonresident flag
 D: Starting point of data run
 E: End-of-record marker (FF FF FF FF) for the MFT record

Figure 5-12 Nonresident file in an MFT record
 Courtesy of X-Ways AG, www.x-ways.net

Non-resident file attributes

Table 5-5 Attributes in the MFT

Attribute ID	Purpose
0x10	\$Standard Information This field contains data on file creation, alterations, MFT changes, read dates and times, and DOS file permissions.
0x20	\$AttributeList Attributes that don't fit in the MFT (nonresident attributes) are listed here along with their locations.
0x30	\$FileName The long and short names for a file are contained here. Up to 255 Unicode bytes are available for long filenames. For POSIX requirements, additional names or hard links can also be listed. Files with short filenames have only one attribute ID 0x30. Long filenames have two attribute ID 0x30s in the MFT record: one for the short name and one for the long name.
0x40	\$ObjectID (\$Volume_Version in Windows NT) Ownership and who has access rights to the file or folder are listed here. Every MFT record is assigned a unique GUID. Depending on your NTFS setup, some file records might not contain this attribute ID.
0x50	\$SecurityDescriptor Contains the access control list (ACL) for the file.

Basic information of a file in MFT starts at 0x10

See slide 29 on chapter 5
 for more information on
 attribute ID

– At offset 0x14 - length of the header (indicates where the next attribute starts) 38 00 → 00 38 = 56 bytes!!

Revision on important Concepts this week...

- Is there a difference between **Steganography** and **water marking**?

Steganography and **watermarking** bring a variety of very important techniques on how to hide important information in an undetectable and/or irremovable way in audio and video data.

Steganography: hide the very existence of the data. Adversary doesn't know of a secret communication.

Watermarking: either **visible** or **invisible** and used to identify **ownership** and **copyright**.

Some quizzes...

8

1. What is the purpose of BIOS (Basic Input Output System)?

- ☐ To improve on computer memory
- ☐ To ensure image is well displayed on monitor
- ☒ It contains programs that perform input and output at hardware level
- ☐ It transfers files out of hard disk when hard disk is full

2. Cluster size vary according to disk drive size and file system. For FAT file system, what is the size of cluster for a 256MB disk drive?

- ☐ 2KB
- ☒ 4KB
- ☐ 8KB
- ☐ 16KB

3. 1. Basic information of a file or folder in NTFS MFT environment, starts at attribute ID:-

- ☒ 0x10
- ☐ 0x20
- ☐ 0x30
- ☐ 0x40

4. 1. What is the purpose of Registry in windows environment?

- ☐ To register all files and folders
- ☒ To store hardware and software configuration information
- ☐ To enhance speed of memory in the computer
- ☐ To act as a network device like router or switch when required

5

1. What is the issue with virtual machine when perform digital forensic?

- ☐ Virtual machine does not have wifi
- ☐ Virtual machine always do not have enough virtual disk space
- ☒ Virtual machine does not have file slack and unallocated space
- ☐ Virtual machine is always not stable and can crash easily

This Week Lab - Steganography

9

- ▶ Download “**Prac 5v2.zip**” from BrightSpace and unzip the file in your Magnet VM windows environment.
- ▶ We are going to work on **Steganography** this week
- ▶ Following instructions in “**Pract 5 Labv5.pdf**” document to work on your lab this week. Remember to **unzip** each exercise before you start your work.
 - ▶ Note : Exercise 9 (zip file 8) is about **EXIF file type**, **EXIF image viewer** website and **SPAM MIMIC** site.
- ▶ This will be your last practical before term ends
